Demonstration. Built from synthetic data.

Are we paying too much to trade?

Yes, and part of it can be saved.

Trading cost 22.4 bps of what was traded, which is not unusual in itself. What stands out is Gamma Capital: +17.2 bps against what similar orders should cost, with the interval clear of zero.

USD 9.9m
cost in 55 trading days

+17.2 bps
Gamma Capital, against the model

USD 12.3m
a year within reach

Decisions needed

	DECISION	WHO	BY WHEN
1	Put Gamma Capital on formal review and ask for an explanation of its limit-price fills	Head of trading	This month
2	Have the 444 orders with an exception explained and closed	Traders and compliance	Within 30 days
3	Record the decision price in the order system at the moment the manager decides	Head of trading and the system owner	This quarter
4	Decide how to shift flow towards the cheaper brokers and algorithms	Best-execution committee	Next meeting

The evidence is in the report; each broker has its own page in the scorecards; the policy sign-off is in the best-execution report.
